TechZeen

AI OBSERVABILITY

YOUR AI APPLICATION IS WORKING, BUT DO YOU ACTUALLY KNOW WHY IT'S GIVING WRONG ANSWERS?

TechZeen

AI OBSERVABILITY

- Understand the internal behavior of AI applications.
- Monitor performance, quality, latency, and token usage.
- Identify errors and unexpected behavior.

LOGS

- Record important application events.
- Capture errors, warnings, inputs, and outputs.
- Include timestamps, request IDs, and useful metadata.
- Avoid logging sensitive user information.

TechZeen

TRACES

- Track the complete execution of an AI request.
- Understand how different components interact.
- Follow execution across LLMs, tools, agents, and databases.

SPANS

- Represent individual operations inside a trace.
- Track LLM calls, retrieval, tool execution, and other tasks.
- Measure duration and identify failures.

TechZeen

LANGSMITH

- Trace and debug LLM applications.
- Inspect prompts, model responses, and execution steps.
- Evaluate AI outputs and monitor application performance.

TechZeen

LANGFUSE

- Open-source LLM observability platform.
- Track traces, generations, and token usage.
- Monitor latency, cost, and application quality.
- Support prompt management and evaluation workflows.

TechZeen

AI DEBUGGING

- Identify exactly where an AI workflow fails.
- Inspect retrieved documents and tool calls.
- Analyze incorrect model outputs.
- Compare successful and failed executions.

TechZeen

PRODUCTION MONITORING

- Track error rates and latency.
- Monitor token consumption and API costs.
- Identify recurring failures.
- Continuously improve AI application reliability.
